

Developed for **Pipelines** *by Pipeline People*

LINEMARK MESH *Brand Underground Warning Mesh* was especially developed by pipeline managers and engineers working with industry consultants to better meet today's higher demands for community safety, agency regulatory compliance and increasing construction and maintenance performance standards throughout the North American pipeline industry. This polymer product was developed specifically for use by pipelines and is available in two special pipeline application widths, 24" & 48". Standard rolls are approximately 250 feet in length. Special lengths are also available up to 1000 feet. Normal wording schemes meet or exceed OSHA and DOT regulatory standards for safety graphics. The warning graphic continuously repeats throughout the entire length of the product. Typical applications include company name and either a one-call number or proprietary company control center number along with a large warning panel printed adjacent to the copy.
